Builder Quick Reference

A desk reference for the next prompt, fix, and claim of done.

Before you start

Name one outcome and define what must stay working. Review existing changes and save a known-good commit. Use a branch for risky work; it does not back up uncommitted files or shared services.

The working loop

Specify > Branch > Small change > Test > Commit > Next

Inspect the diff, run relevant checks, and try the real user path. Record evidence before moving on.

Before you accept done

App starts; relevant page loads. Requested behavior works through the real user path.

Expected saved data survives refresh. A relevant edge case and related flows have been checked.

If affected, check access and session behavior. Inspect scope and secrets in the diff.

Run relevant automated checks. Record actual results, anything not tested, and open issues.

When something breaks

Record expected behavior, actual behavior, reproduction steps, and error or screenshot. Investigate the server, browser, request, or access layer before assuming the cause. Ask for a small diagnosis and scoped fix.

Keep the receipt

Change: _____ Check performed: _____

Actual result: _____ Not checked: _____

Next safe step: _____

Useful instruction

Review this change against the request. List what was tested, what was not tested, and what remains unresolved. Do not call it complete based only on a successful build.

Go further

Use the editable ROADMAP, Project Rules, and Before You Accept Done starters. This reference supports everyday checks; it is not a complete security audit or launch certification.
